Knowledgebase Assistant – Implementation Plan

1. Project Overview

This document describes the implementation approach for the Governed Knowledgebase Assistant workflow built using Google Opal.

2. Implementation Steps

Step 1: Create the Workflow

Create a Google Opal application named **Knowledgebase Assistant**.

Step 2: Configure Employee Input

Create the Employee Query step to collect workplace questions.

Step 3: Upload SOP Documents

Upload the following fictional demonstration assets:

- `employee_leave_policy.md`
- `it_support_sop.md`
- `expense_reimbursement_policy.md`

Step 4: Configure Classification

Create the Classification Result step to classify queries as OPERATIONAL or SENSITIVE.

Step 5: Configure Governance Routing

Create the Governance Classifier with two conditional destinations:

- OPERATIONAL → Grounded Research Agent
- SENSITIVE → Human Escalation Handler

Step 6: Configure Grounded Research

Create the Grounded Research Agent to retrieve information from the uploaded SOP documents and prepare answers supported by the documents.

Step 7: Configure Human Escalation

Create the Human Escalation Handler to prepare notifications for sensitive queries.

The configured recipient is `hr_manager@company.com`. This is a demonstration configuration; it does not establish that an email was delivered.

Step 8: Configure Final Output

Create the Display Response step to present the selected workflow response clearly.

3. Workflow Sequence

1. Employee submits a workplace query.
2. Classification Result identifies the query category.
3. Governance Classifier selects the appropriate route.
4. The selected agent prepares an operational answer or human escalation notification.
5. The workflow displays its response.

4. Implementation Principles

- Use only uploaded SOP content for operational answers.
- Do not fabricate missing policy details.
- Treat sensitive employee queries confidentially.
- Route sensitive matters for human review.
- Preserve the original employee query.
- Do not claim email delivery without integration confirmation.

5. Implementation Verification

The workflow preview was used to test an operational leave query and a sensitive harassment query.

Verification Item	Status

Operational classification and display	PASS
Sensitive classification and safe response display	PASS
Separate escalation notification output	PENDING
Email delivery integration	NOT CONFIGURED
Full SOP grounding verification	PENDING

6. Completion Criteria

The implementation is considered functionally demonstrated when:

- Employee queries can be submitted.
- Queries are classified correctly in the tested scenarios.
- Operational responses are displayed.
- Sensitive queries receive a human-review response.
- Unsupported claims and unconfirmed email delivery are avoided.
